Folio

A course assistant inside IntelliJ.
It answers from the lectures, and it shows the page.

What it is

A tool window on the right of IntelliJ.
It answers from the lectures on this machine,
and it names the page.

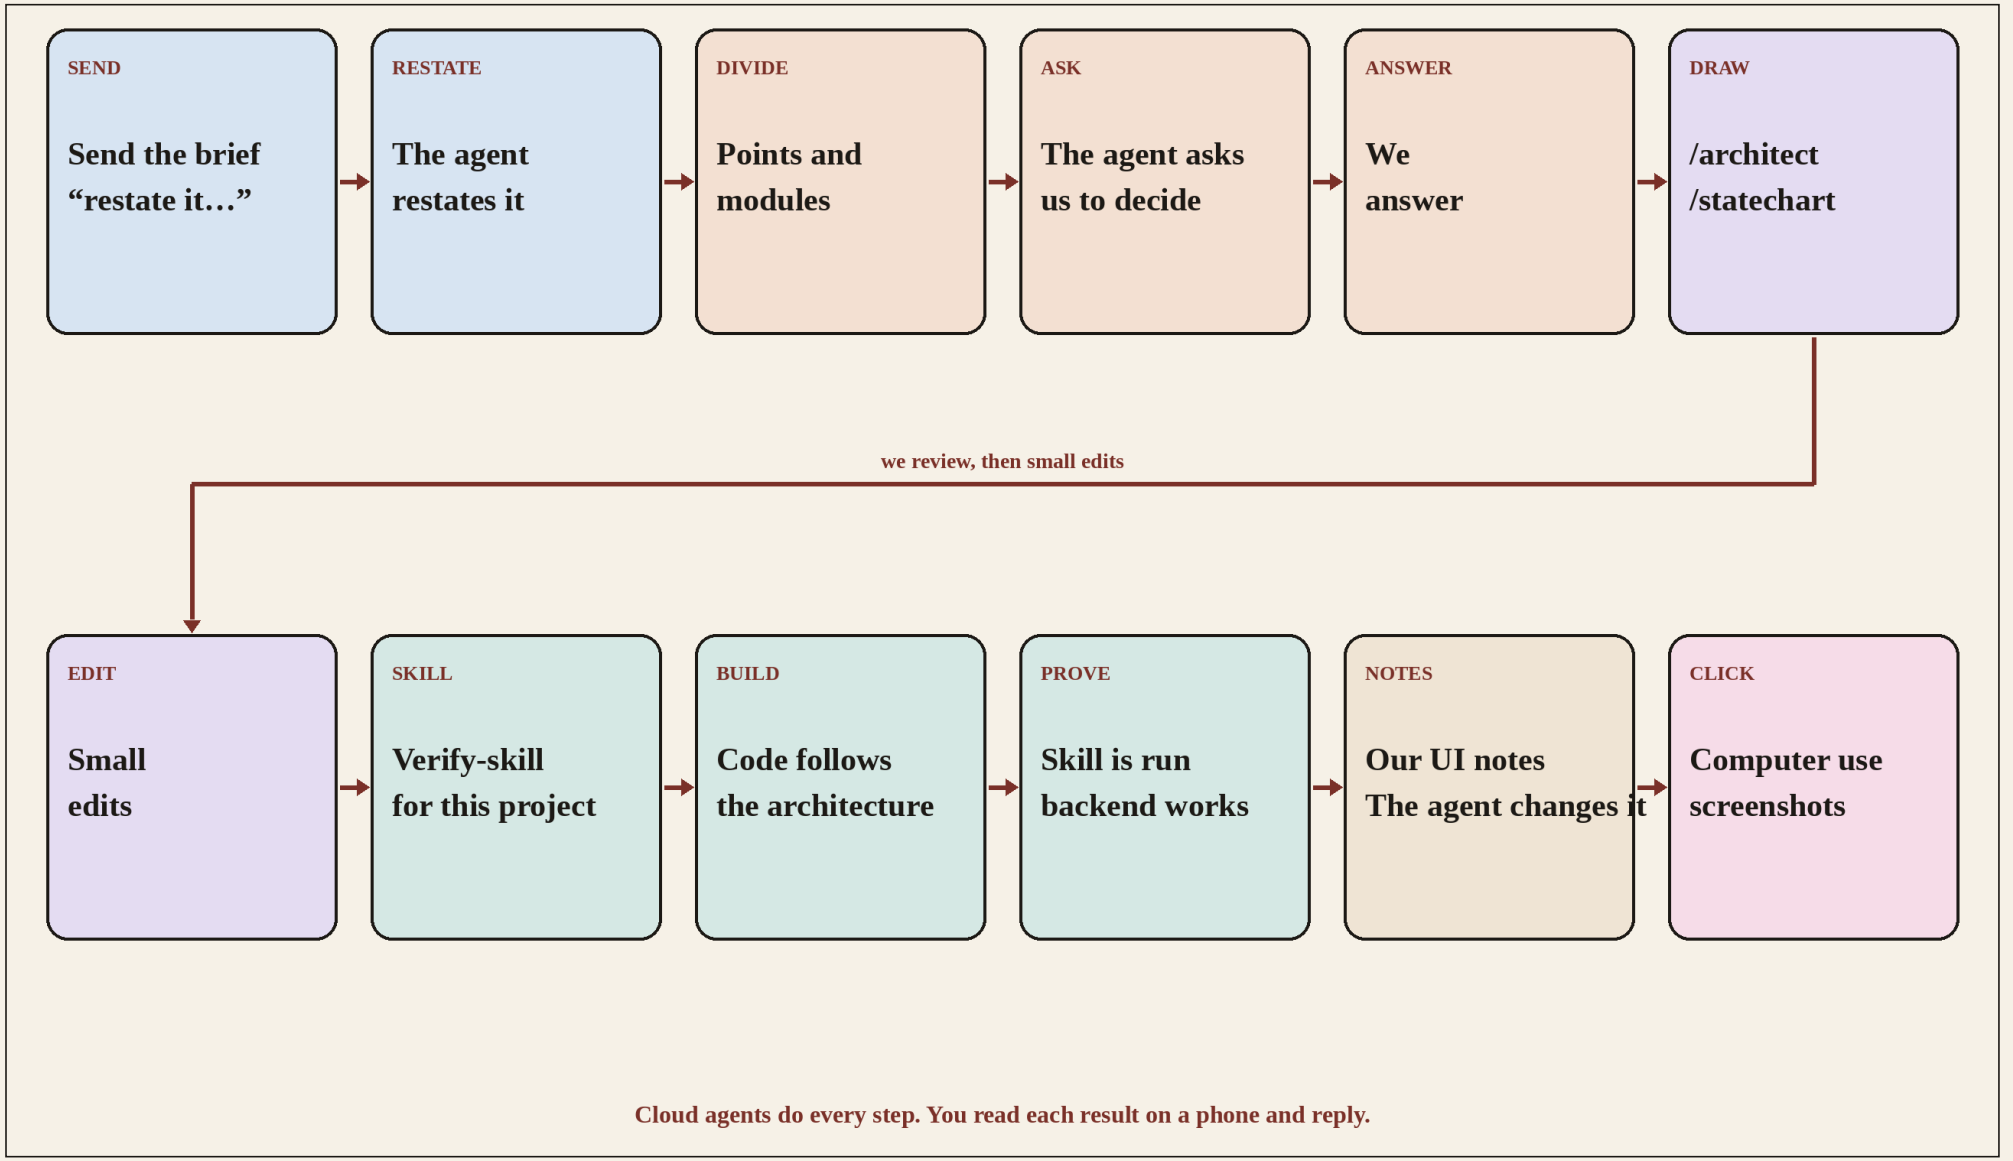

The picture is that answer: @Test,
from Lec-3.4, pages 3 and 2.

F0	Course retrieval. Chunk, index, retrieve, cite the page.
F1	A drill. A JUnit preview written only when asked.
	Commit text from the staged diff.
Not ours	Group C rewrites code and drives the diff viewer.

How it was made

03 MAKING

Decisions that stayed with us

After the restatement, the agent named the choices it would not make alone.

Retrieval	A local word index, not an embedding service.
The third action	A course drill. Not Group C, and not another ask.
Tests	Show a preview. Write the file only after a click.
Commits	Show the message. Do not run git commit.
The model	The address stays in settings. This demo uses DeepSeek.

What the window does

04 THE WINDOW

Import PDF, PPTX, TXT, Markdown, DOCX. No key to index.

Ask The answer streams. Thinking stays apart.

Cite [1] is the file and the page. A miss invents no page.

Drill Three exercises after they parse. The editor stays.

Tests Preview first. Write file is the only write.

Commit Stage, then candidates. No git commit.

Settings The key is in the OS keyring. The field stays empty.

Drafts Each mode keeps its text. A new chat keeps drafts.

From a file to a page

04 THE WINDOW

1 File. Page and slide numbers stay as they are.

2 Chunk. About 700 characters, overlap 100.

3 Index. Local words. No embedding service.

4 Retrieve. At most four chunks. Half the terms.

5 Answer. The model marks a chunk as [1].

6 Page. [1] opens that file and page.

A Chinese question

根据课件，JUnit 5 的测试方法
通常用哪个注解？

The lectures are in English.
Those Chinese fragments are not
on the pages. If they also had to
be covered, nothing would match.
When none of the Chinese is in the
library, and JUnit is, the search
uses JUnit alone.
It hits Lec-3.4, pages 3 and 2.
No Latin word: this path is not used.
One Latin word in a long unrelated
question is still not enough.

Two ways the project can change

04 THE WINDOW

Tests

You describe the scenario.

A Java preview. Syntax and shape.

It is not run.

You click Write. The file appears.

Cancel writes nothing.

Commit text

Stage is a separate click.

Folio captures that staged diff.

Three candidates.

Copy one, or fill the commit box.

A changed staging area is refused.

Nothing here runs git commit.

Ask and drill have no path to a file or a commit.
