Folio

A course assistant inside IntelliJ.
It answers from the lectures, and it shows the page.

What it is

Folio lives in a tool window on the right of IntelliJ.

It indexes the course files on the machine. A question retrieves a few pages and asks the model to answer from those pages.

The reply names the file and the page. The page can be opened.

Three further actions sit in the same window: practice, a JUnit preview, and commit messages.

Group C owns rewriting source and the diff viewer. Folio does not.

What the brief required

F0

Course retrieval

Cut the lectures into chunks. Index them. Retrieve the best. Cite the file and the page or the slide.

F1

Three IDE actions

A drill on the selection. A JUnit preview that is written only when asked. Commit messages from the staged dif

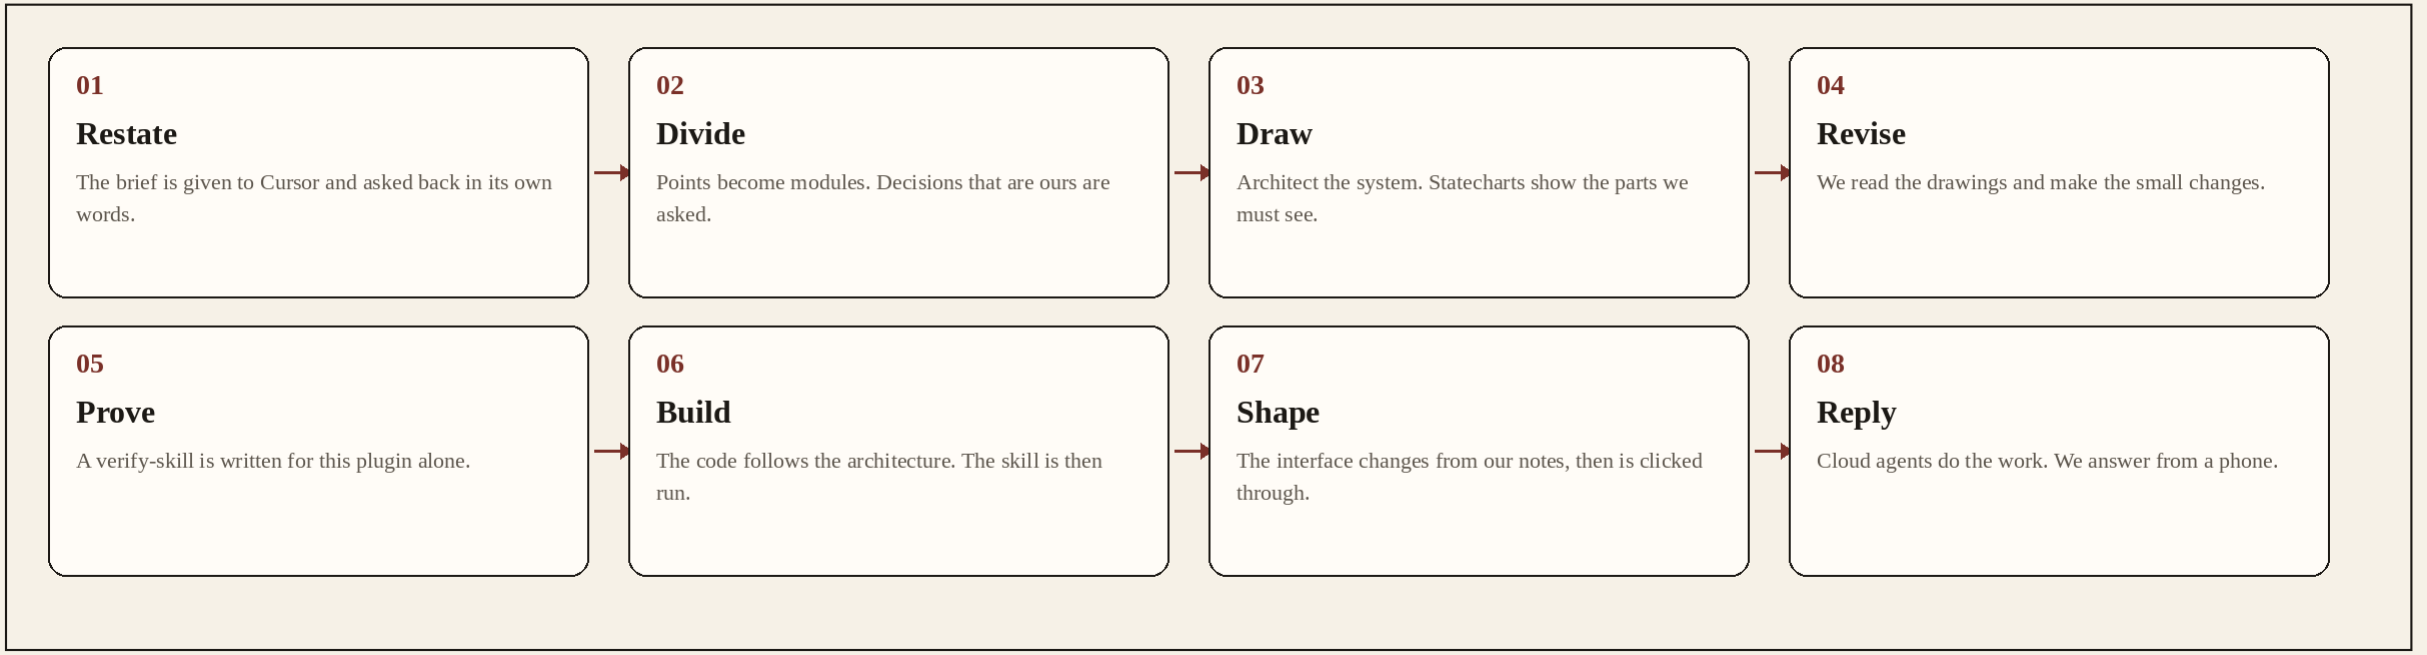

NOT OURS

Group C

Changing the student’s code from an instruction, and driving the built-in diff viewer.

03 MAKING

How it was made

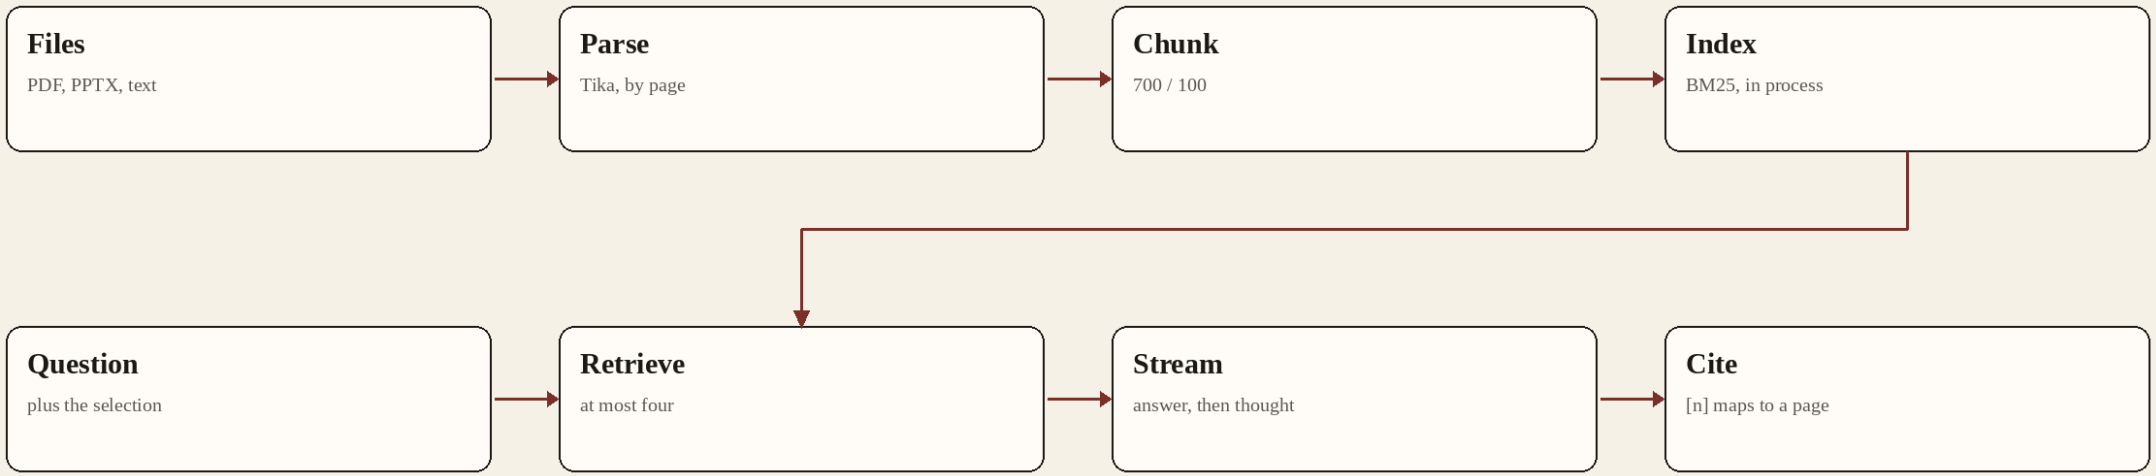

Decisions that stayed with us

After the restatement, Cursor named the choices it would not make alone.

Retrieval	A local word index, not an embedding service.
The third action	A course drill, not a rewrite and not another answer.
Tests	A preview first. The file is written only on a click.
Commits	Show the message. Do not commit, and do not touch the index.
The model	The address stays in settings. This run uses DeepSeek.

The retrieval path

Local retrieval. The model never sees a file it was not given.

History is quoted for the model. It is not evidence for a citation.

A drill reads the same stream and shows three exercises only after they parse.

No embedding service. A missing key still retrieves, and makes no HTTP call.

One question

1. **Ask**
   The question and any selected code.
2. **Find**
   BM25 returns at most four chunks.
3. **Write**
   Answer text arrives as tokens. Thinking stays apart.
4. **Point**
   After the reply, [1] becomes a file and a page.
5. **Open**
   The source title shows the indexed excerpt.

Three actions

Practice

Three exercises.

Each explanation opens alone.

The editor is not touched.

Tests

A scenario first.

Then a Java preview.

A file appears only on Write.

Commits

Staged diff only.

Candidates can be copied.

Folio never commits.

Then it was run

The verify-skill drives the real Folio window.

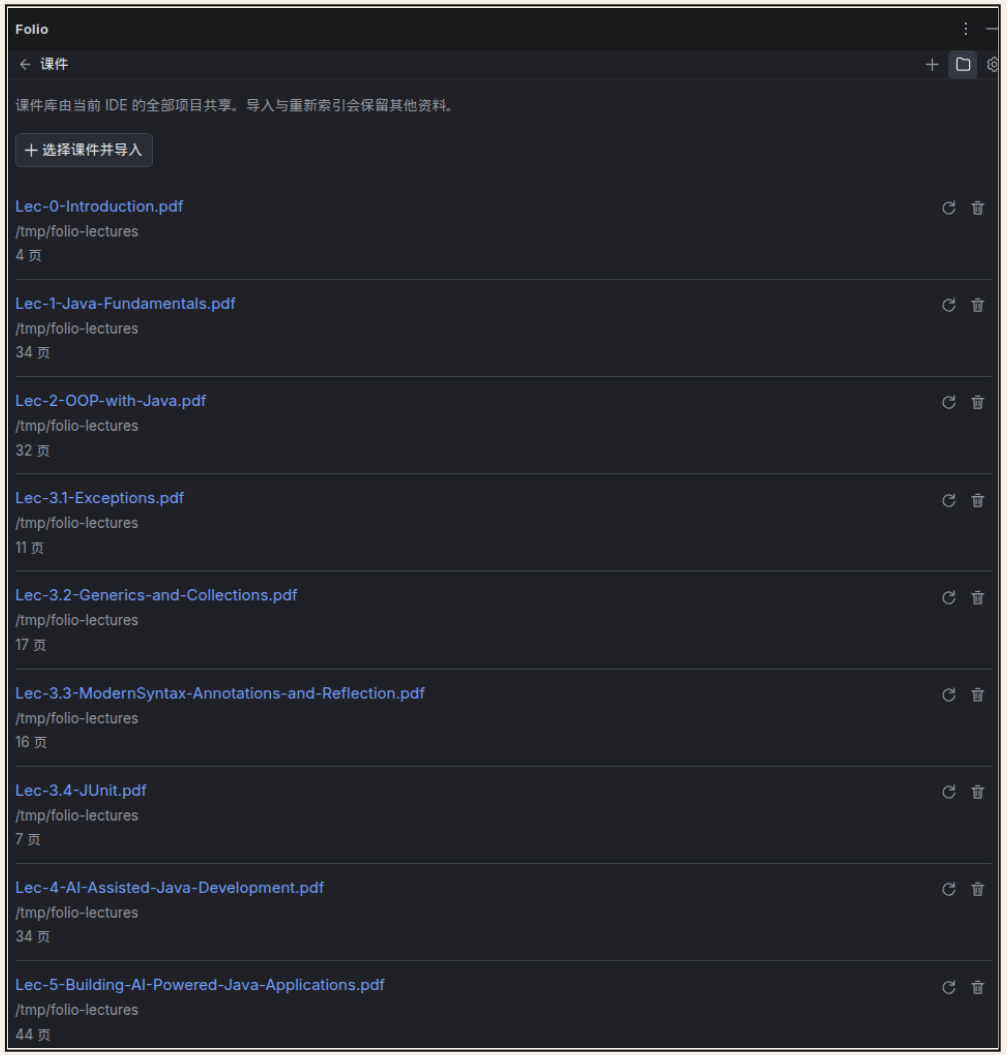

Nine lecture PDFs were indexed. A Chinese question for the JUnit annotation cited Lec-3.4, pages 3 and 2.

The source title opened the excerpt. The editor did not change.

The picture is that excerpt.

The window, after our notes

Left, the nine lectures.

Right, settings. The key field stays empty.

What we will click

1. The nine PDFs.
2. One question, left long enough to stream, then a citation opened.
3. Three exercises. One explanation. The other two stay closed.
4. Stop a second question while it is still thinking.
5. Settings, then new chat, then cancel.

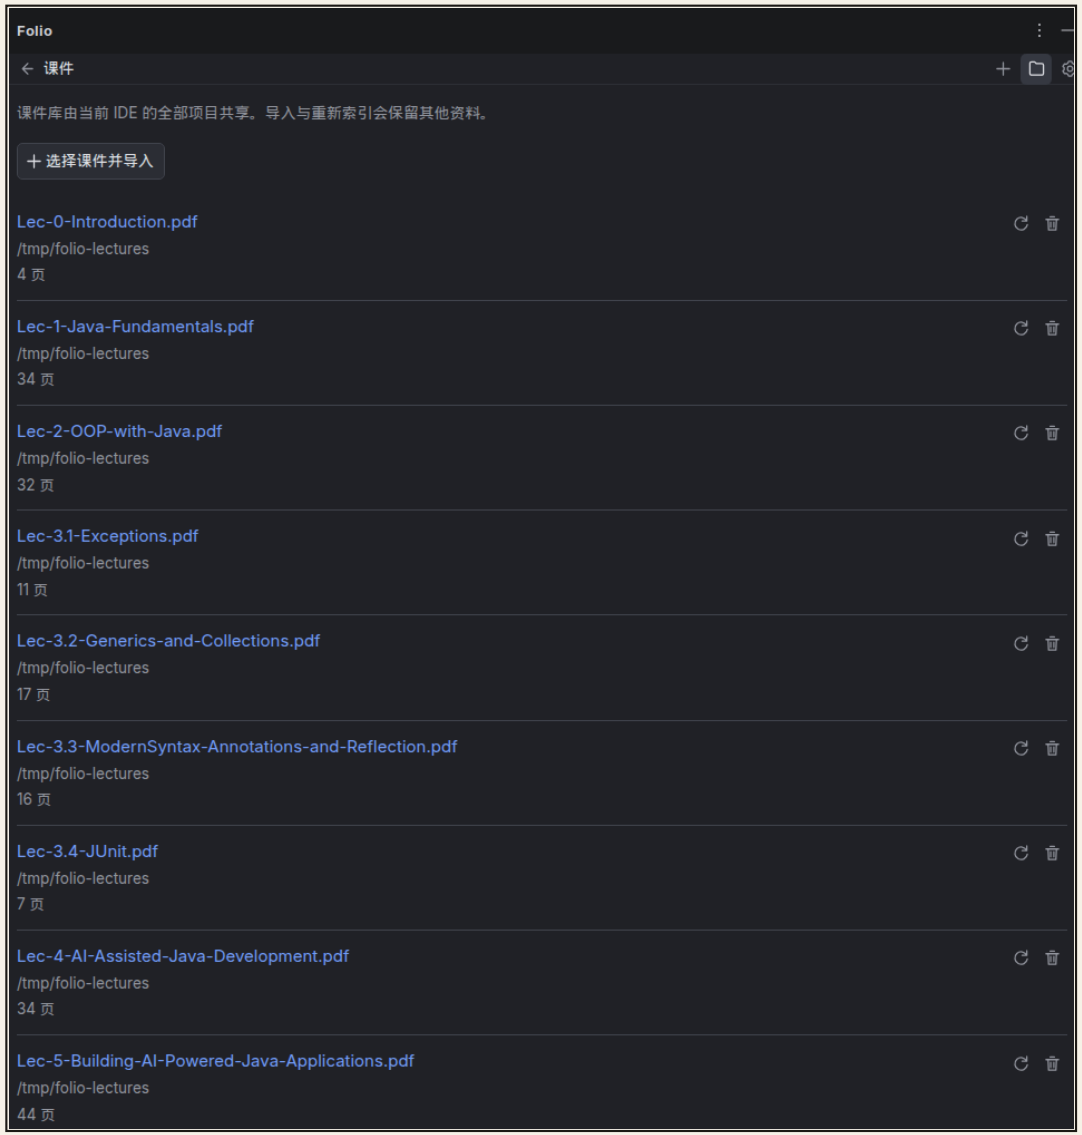

The lectures

Lec-0 through Lec-5.

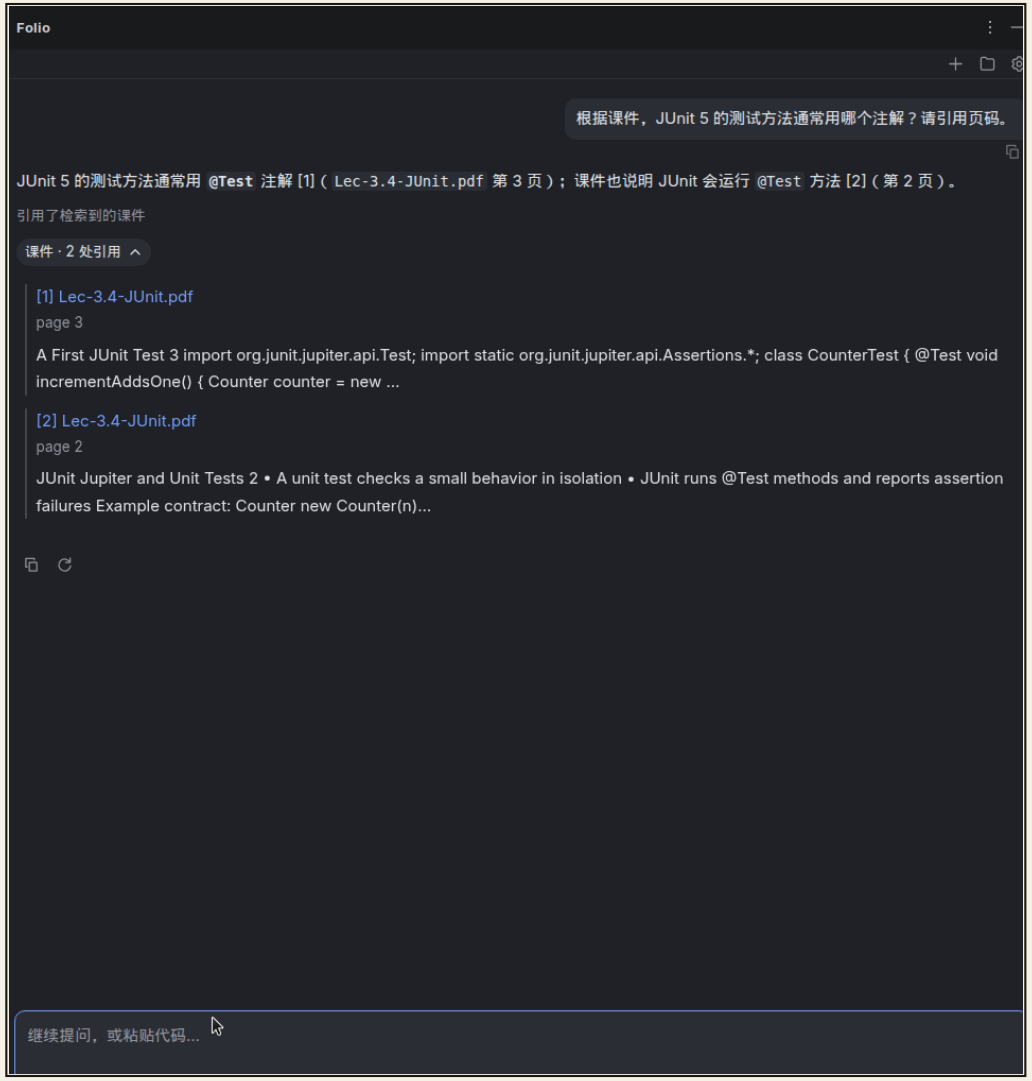

Lec-3 is four files.

Indexing did not need a key.

Removing a file asks first.

An answer, and the page it came from

Three exercises

Checked and unchecked exceptions.

The first explanation is open.

The other two stay closed.

This view appears when the

three exercises parse.

What the picture is not

A shared word	is not yet a correct sentence.
A thinking block	shows while streaming, then goes.
A test preview	is syntax and annotations, not a run.
A commit draft	does not create a commit.
